11. Pigs	0	0	155	0	155
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.

2.) Each principal investigator has considered alternatives to painful procedures.

3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). **A summary of all such exceptions is attached to this annual report.** In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.

4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

This form is intended as an aid to completing the Column E explanation. It is not an official form and its use is voluntary. Names, addresses, protocols, veterinary care programs, and the like, are not required as part of an explanation. A Column E explanation must be written so as to be understood by lay persons as well as scientists.

1. Registration Number: 56-R-003

2. Number 7 of animals used in this study.

3. Species (common name) Southern Short-tail shrew of animals used in the study.

4. Explain the procedure producing pain and/or distress.

Blarina carolensis, the southern short tail shrew, has an extremely high metabolic rate and does not tolerate stress well. When captured in live traps, they often rapidly die. The animals captured in this study are trapped using Sherman live traps that are only set at night to avoid potential hyperthermia. At dusk the traps are set and at sunrise the traps are checked, animals are tagged, recorded and released, and the traps are closed for the day. The absolute maximum time that an animal could remain in the trap is 10 hours. Blarina are not the target species for this experiment, however, 7 of them were found dead in traps during this period.

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For Federally mandated testing, see item 6 below)

The justification for these animals being placed in category E is not scientific, but logistical. There is no way to prevent this species from being trapped short of not performing the study. The traps are checked regularly. More frequent checks would decrease the ability to capture animals and successfully complete the study. And finally, since the animals die acutely from stress, there are no possible cage modifications that we are aware of that would increase survival. It appears that any trapping of these animals entails a high mortality.

6. What, if any, federal regulations require this procedure? Cite the agency, the code of Federal Regulations (CFR) title number and the specific section number (e.g., APHIS, 9 CFR 113.102):

Column E Explanation

This form is intended as an aid to completing the Column E explanation. It is not an official form and its use is voluntary. Names, addresses, protocols, veterinary care programs, and the like, are not required as part of an explanation. A Column E explanation must be written so as to be understood by lay persons as well as scientists.

1. Registration Number: 56-R-0115

2. Number 132 of animals used in this study.

3. Species (common name) Hamster of animals used in the study.

4. Explain the procedure producing pain and/or distress.

Intruder hamsters were placed in cages with resident hamsters. Hamsters are not social creatures. The behaviors of the intruder toward the resident and vice versa were observed and scored (see attached). These encounters caused distress in the animals similar to that of an intruder entering your home. In addition, occasional aggressive interactions (fights) were observed. In these studies, two animals sustained minor cuts as a result of these interactions. They were removed from the study. Their injuries healed within a few days.

In addition, both dominant and subordinate animals were tested for their levels of anxiety using a radial arm maze.

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For Federally mandated testing, see Item 6 below)

Any intervention in these interactions would have affected the outcome of the study.

6. What, if any, federal regulations require this procedure? Cite the agency, the code of Federal Regulations (CFR) title number and the specific section number (e.g., APHIS, 9 CFR 113.102):

Agency_____CFR_____

53 animals were listed in section E, with the following justification:

(Listed in AUP 33) Fighting and social defeat are physiological and psychological stressors. In comparison to behavior models that use artificial stressors (e.g., shock) to induce aggression and submission/avoidance, animal models that use social conflict to induce these behaviors appear to be associated with a milder stress response. Moreover, we are specifically interested in studying learned avoidance following defeat and the anxiogenic ("anxiety causing") effect of social conflict that may generalize to a non-social context. Analgesics and anxiolytics may counteract behavioral effects of social conflict.

Furthermore, 28 of these *same* Syrian hamsters were transferred to another approved research protocol involving unrelieved pain. The justification for that method appears below:

(Listed in AUP 32) The studies proposed are designed to determine the efficacy of topical analgesic gels on relieving pain-like behaviors after an acute short lasting inflammatory injury. As such, we are unable to administer analgesic agents as this would be a confound to determining whether the compounds being studied produce analgesia. These studies involve using an acute inflammatory injury; rodents express a short (60 minute) duration spontaneous behavioral pattern of licking the hindpaw, shaking the hindpaw, and hindpaw flicking. At the end of the 60-minute period these spontaneous behaviors have resolved and the animals are returned to their home cage. Once back in their home cage the animals do no show spontaneous behaviors associated with the injury. They have normal weight gain, normal cage activity, normal grooming and an absence of overt stress responses. Our studies conform to the ethical guidelines for investigation of experimental pain in conscious animals (Pain 16, 109-110, 1983). None of the procedures outlined require the use of restraints. Where appropriate we use isoflurane to produce rapid induction and recovery from anesthesia.
